Overview & surfaces

Medium Format is an independent record shop in Jakarta and the platform that operates it. The system is strictly black & white — a near-black canvas in the dark theme, white in the light theme, one neutral grey scale between. Noto Sans sets every word; Noto Sans Mono sets the figures that must align (prices, catalogue numbers, barcodes, IDs). Colour appears only to signal status, plus a per-channel key for scannability.

Storefront

Public catalogue

Dark-first commerce: release grid, filters, release detail, cart, Xendit checkout, account, news. Now-Playing bar carries the brand.

Back-office

11-module console

Dense operational tool: dashboard, inventory, locations, orders, customers, vouchers, newsletter, POs, news, channels, preferences.

POS

In-store terminal

Touch point-of-sale: product browser, cart, and a checkout with bank EDC terminals + Xendit gateway + cash.

Character: plain, modern, understated. The only mark with expression is the logomark — a record seen side-on. Everything else stays quiet so the records and artwork are what you look at.

Colour

Black and white carry the whole system; there is no brand accent colour — the interactive accent is simply the opposite of the background. A small status set marks stock and order state; a channel key (v2.1) is the one sanctioned exception for scannability.

Surface — dark (default) / light

 Canvas #000000 / #FFFFFF	 Surface #0E0E0E / #FFFFFF	 Raised #1A1A1A / #F5F5F5	 Hairline #2A2A2A / #E4E4E4
---	--	--	---

Status — stock & orders only

 Success #22C55E	 Info #3B82F6	 Warning #F59E0B	 Danger #EF4444
--	---	---	---

Channel colour key — v2.1, channel indicators only (coloured dot + text on a neutral pill)

 Website	 POS	 Tokopedia	 Shopee
 Discogs	 Bandcamp	 eBay	 Event

Colour discipline: the brand is monochrome. Status colour marks only stock/order state. The channel key never signals status and never decorates — it only distinguishes sales channels in dense multi-channel lists.

Typography, spacing & elevation

Type scale

TOKEN	SIZE / WEIGHT / LINE	FACE	USE
display-xl	40 / 600 / 48	Noto Sans	Storefront hero
display-lg	32 / 600 / 40	Noto Sans	Page hero
h1	24 / 600 / 32	Noto Sans	Page titles
h2	20 / 600 / 28	Noto Sans	Section headings
h3	16 / 600 / 24	Noto Sans	Release title on cards
body	14 / 400 / 20	Noto Sans	Default UI text
label	12 / 500 / 16 · UPPER	Noto Sans	Field labels, badges
mono-price	14 / 500 / 20	Noto Sans Mono	IDR price (USD secondary)
mono-meta	12 / 400 / 16	Noto Sans Mono	Cat#, SKU, barcode, order ID

Spacing (base 4)

xxs 4 · xs 8 · sm 12 · **md 16** · lg 20 · **xl 24** · 2xl 32 · 3xl 40 · 4xl 48 · 5xl 64.
Card padding 16–20; page gutters 24–32.

Radius

sm 4 · **md 6** (buttons/inputs) · **lg 8** (cards/covers) · xl 12 (modals) · pill 999 (chips/badges) · full 9999 (avatars).

Elevation

Depth comes from surface steps + hairlines, not heavy shadow. Shadow appears only on things that float:

- **0 Flat** — default; surface + hairline
- **1 Drop** — 0 1 2 rgba(0,0,0,.5); dropdowns
- **2 Float** — 0 4 12 rgba(0,0,0,.6); Now-Playing, sticky bars
- **3 Dialog** — 0 8 24 rgba(0,0,0,.7); modals, sheets
- **Focus** — 2px ring in the accent colour

Components & header bars

Buttons

- **Primary** — accent fill / accent-text; radius 6; one per view
- **Secondary** — transparent, 1px hairline, ink text
- **Ghost** — text only, hover raised
- **Destructive** — danger text, 1px danger 40%

Chips, badges & tags

- **Filter chip** — pill; active = accent outline + ink
- **Status badge** — pill + 12% tint + dot ●●●●
- **Condition grade** — neutral mono pill (M/VG+/VG/G+/G)
- **Channel tag** — coloured dot + text (channel key)

Signature components

- **Release card** — 1:1 vinyl-groove cover, artist/title/price, stock badge, audio-preview dot
- **Now-Playing bar** — fixed bottom, Level-2 float, accent scrubber
- **Back-office sidebar** — 11 modules, icon+label, Orders pending dot
- **Barcode label** — printable item label (v2.1)

Panel / section header bar (v2.1)

The labelled strip atop a content panel/card is a solid accent bar — **black bar + white text in light, inverted in dark** (it follows `--accent` / `--accent-text`). Applies to panel/section headers only — not page titles, table column rows, sidebar/topbar/nav, or dialog headers. Status badges & channel tags inside a header keep their own colour.

REVENUE & NET MARGIN

3M · 6M · 12M

Panel body sits below the accent header, on surface with a hairline. Tabs on the bar dim to ~55%; the active tab flips to an inverted chip.

Screen inventory

22 screens, each built desktop + mobile (44 files) in the monochrome system, plus a prototype hub and a single-file preview.

Storefront		Back-office		POS	
SCREEN	FILE	SCREEN	FILE	SCREEN	FILE
Catalogue	storefront	Dashboard	dashboard	POS sale	pos
Release detail	release	Inventory	inventory	POS checkout	pos-checkout
Cart	cart	Locations	locations	System

Confirmation	confirmation	Orders	orders	Prototype hub	index
Account	account	Order detail	order-detail	All-screens preview	preview
News article	journal	Customers	customers	Not found	404
		Vouchers	vouchers		
		Newsletter	newsletter		
		Purchase orders	purchase-orders		
		News updates	news		
		Channels	channels		
		Preferences	preferences		

Locations & shelves

Stock is tracked across multiple physical locations, each with its own shelves. Reached from Inventory → Locations.

- **Location management** — add / edit / remove locations (Main Store, Warehouse, Pop-up, Consignment), each with type, address, item count, shelf count and low-stock figure.
- **Shelf editor** — add/remove shelves per location (A1, A2, C2, Crate 1...).
- **Stock-by-shelf monitor** — every item's location + shelf + qty + stock status, filterable by location.
- **Per-location allocation on the release form** — the Add/Edit release "Stock & location" section allocates quantity across locations + shelves, with a live total ("N across M locations").
- Item labels print the item's location · shelf (see §07).

Barcode labels

Every inventory row can print a physical item label for shelf tracking.

- Row action **Print barcode** opens a print-ready label: Medium Format mark, scannable barcode, SKU (mono), artist — title, cat# · condition · price, and the item's location · shelf.
- The label always renders **black-on-white** (prints correctly regardless of theme); a print stylesheet isolates just the label.
- SKU is derived deterministically per release; barcode encodes the SKU.
- Available on both desktop and the mobile inventory cards.

Channel colour key

To make dense multi-channel lists (orders, inventory, customers, dashboard) scannable, each sales channel carries a fixed hue — the one sanctioned exception to monochrome discipline.

CHANNEL	HUE	CHANNEL	HUE
Website	#6366F1	Discogs	#9CA3AF
POS	#0EA5E9	Bandcamp	#14B8A6
Tokopedia	#22C55E	eBay	#EAB308
Shopee	#F97316	Event	#EC4899

Rendered as a coloured dot + coloured text on a neutral pill in tables, and as a tinted icon on the Channels integration cards. Tokens live under `color.channel.*` in `tokens.json`.

POS payments — EDC + Xendit

The POS checkout offers two clearly separated payment families plus cash.

A · Card terminal (EDC)

Physical acquirer terminals: **BCA, Mandiri, BNI, BRI, CIMB Niaga, Permata**. Selecting a bank runs the terminal flow: insert/tap/swipe → reading → processing → **Approved** panel with Approval Code, RRN/Ref, Batch, Trace, masked PAN, scheme (Visa/Mastercard/GPN) and entry mode. A **Declined** path is included.

B · Xendit (online gateway)

"Secured by Xendit": **QRIS** (scan block), **Virtual Account** (BCA/Mandiri/BNI), **e-wallet** (GoPay/OVO/DANA/ShopeePay), and **card**. Each shows an appropriate waiting/confirmed state.

Cash supports amount-tendered → change due. Completing a sale prints a receipt showing the payment method used (e.g. "EDC · BCA · Visa chip" or "QRIS · Xendit"). The storefront checkout uses Xendit for online orders.

Responsive & theming

BREAKPOINT	WIDTH	KEY CHANGES
Mobile	< 640	Grid 2-up; filter rail → drawer; sidebar → hamburger; tables → stacked cards; Now-Playing pinned
Tablet	640–1024	Grid 3–4-up; sidebar → icons; tables scroll
Desktop	1024–1280	Grid 5-up; full sidebar with labels
Wide	≥ 1280	Grid 6-up; content caps ~1280 and centres

Theme — dark is the default across storefront and back-office; the light theme is toggled from the topbar and stored per browser (`localStorage['mf-theme']`). Every value inverts through `--accent` / `--accent-text` . **Touch** — controls render ≥ 44px on touch viewports. Dedicated phone-framed mobile mockups accompany every screen.

Prototype, preview & hub

- `index.html` — **prototype hub**: every screen grouped by surface, Desktop/Mobile toggle, and wired click-through flows (catalogue → release → cart → checkout → confirmation; POS → charge → EDC → receipt; orders → detail → inventory).
- `preview.html` — **single-file preview**: all 22 screens in one place with a Desktop/Mobile toggle, Stage + Gallery views, and open-in-tab.
- All pages self-contained HTML5; only external dependency is Google Fonts. Pages cross-link so the real flows can be walked before development.

Deployment

The static prototype deploys to **mediumformat.info** on the VPS at `vps.lacak.live`.

- `deploy/nginx/mediumformat.info.conf` — HTTP→HTTPS, HSTS + security headers, CSP, gzip, caching, pretty URLs, 404 handling. A `Caddyfile` alternative provides automatic HTTPS.
- `deploy/deploy.sh` — one-command rsync-over-SSH deploy (config in `deploy/deploy.env`). `deploy/README.md` is the full runbook (DNS, certbot, deploy).
- Web-root assets: `favicon.svg` (theme-aware), `robots.txt`, `sitemap.xml`, `site.webmanifest`, branded `404.html`.

Follow-up for the real product: replace the static pages with the `apps/api` (NestJS) + `apps/backoffice` (React) app; move to a nonce-based CSP and self-hosted fonts.
